HW due 02/06 → 6 questions (last question is coding)

→ Average pressure exerted on the walls of the container ⇒ $P = \frac{3}{2} k_B \rho T$; $\bar{\varepsilon} = \frac{3}{2} kT$

→ Experiments done confirming the maxwell-boltzmann distribution of speeds.

↳ starts to fail in quantum scale.

→ Q → Why is there $N_2 > H_2$ in the atmosphere?

↳ difference in the average speed of the molecules as function of temp. (enough to leave the atmosphere due to their higher escape velocity)
