Lecture 25

Thursday, 13 April 2023 1:31 PM

Research Presentation: Exxon Labrage CO_2 capture tech (Largest in the world)

→ Transform CO_2 to make it economically viable

→ pH @ surface is imp.

→ Buffers have MT issues & actually might partake in the mechanism

→ Measure normalized OCP @ ring → measure the current density at ring (calculate then what is happening at the disk)

↳ There is current flow by the ring } Contribution due to primary current dist → Have to correct for this Ohmic drop.

Autoprotolysis equilibrium

→ Ohmic drop gets larger w/ decreasing r_2 (distance between disk & ring) } Since its being affected by the V dist. at the disk
